Note : Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid (Art. 99(1) European patent convention).

Description

This is an invention in the lighting art. More particularly, it is an invention in controlling the light output of fluorescent lamps.

The invention is related to that disclosed in European Patent Application 0399613, that was published only after the filing date of this application. In European Patent Application 0399613 a circuit arrangement for the operation of a fluorescent lamp is disclosed. Said circuit arrangement comprises a ballast and a dimmer connected to said ballast. The dimmer is provided with two control terminals suitable for receiving a control signal generated by a control circuit coupled to the dimmer via the control terminals. During operation of the circuit arrangement the light output of the fluorescent lamp is controlled in dependence of the control signal. Furthermore the dimmer is constructed in such a way that during operation energy is supplied to the control circuit via the control terminals.

French Patent 2.174.679 discloses a control circuit, incorporating a light sensor and two amplifiers, for generating a control signal. In the circuit arrangements disclosed in French Patent 2.174.679, however, relative much wiring is used to enable a proper functioning of the control circuit.

It is an object of this invention to provide a more simplified control circuit for dimming controllers for fluorescent lamps.

One of the advantages of the invention is that an auxiliary power supply which formerly was provided with dimming control circuits is not required with the control circuit of this invention.

One of the features of the invention is that the disclosed dimming control circuit requires less wiring than former dimming control circuits.

In carrying out the invention there is provided a control circuit for a fluorescent lamp dimmer which is connected to the ballast for a fluorescent lamp. The dimmer has two control terminals. The control circuit includes a light sensor which produces an output signal representative of ambient light. The light sensor is connected to a first amplifier which amplifies an output signal of the light sensor. The first amplifier has an output. A second amplifier is connected to the output of the first amplifier. The second amplifier operates to regulate the output signal of the first amplifier. The second amplifier has an output which is connected to a third stage which acts as a current sink. The output of the second amplifier is connected to the third stage which is connected across the two control terminals of the dimmer. The difference between the disclosed invention and prior art control circuits is that the control circuit of the invention receives power for its operating cycle through the control terminals of the dimmer.

Other objects, features and advantages of the in-

vention will be apparent from the following description and appended claims when considered in conjunction with the accompanying drawing in which,

Figure 1 is a block diagram of a dimmer control circuit provided in accordance with former designs; and

Figure 2 is a dimmer control circuit provided in accordance with this invention.

As can be seen from Figure 1, in the past there was provided light sensor 11 whose output is provided to a photo-amplifier for amplification of the signal generated by light sensor 11. Photo-amplifier 13 is connected to regulation amplifier 15. Regulation amplifier 15 produces an output which causes the dimmer control circuit to affect the fluorescent lamps to which it is connected to operate as desired. Regulation amplifier 15 is connected to buffer 17 which acts to render the signals from amplifier 15 suitable for transmission to current sink 19. Buffer 17 is itself connected to current sink 19 which is connected to the fluorescent lamp ballast such as that disclosed in Application Serial No. 358,257.

As can be seen from Figure 1, photo-amplifier 13, regulation amplifier 15, and buffer 17 are all connected to auxiliary power supply 21 which in turn is connected to the power mains.

The invention is shown in Figure 2 of the drawing wherein it is shown that the control circuit is connected to terminals 113 and 114 of Figure 1 of Application Serial No. 358,257. As can be seen in Figure 2 there is provided a light sensor LS which senses ambient light. Light sensor LS is connected across capacitor C one end of which is connected to the base of NPN transistor Q_3 . The other end of capacitor C is connected to the collector of transistor Q_3 .

The emitter of transistor Q_3 is connected to one end of rheostat R_{H1} , the other end of which is connected to one end of light sensor LS. The emitter of transistor Q_3 is also connected to a junction point between resistors R_{2b} and R_{2c} . This junction point is also connected to the base of NPN transistor Q_2 . The collector of transistor Q_2 is connected through resistor R_{2a} to the other end of capacitor C. The emitter of transistor Q_2 is connected to that end of resistor R_{2c} remote from the junction point between resistors R_{2b} and R_{2c} . The collector of transistor Q_2 is also connected to the base of PNP transistor Q_1 whose emitter and collector are connected across terminal 113 and 114 of the dimming controller of Application Serial No. 358,257.

In operation, transistors Q_1 , Q_2 and Q_3 are provided power for operation from the dimming controller associated with the fluorescent lamp or lamps connected to ballast 31. As can be seen no auxiliary power supply such as 21 (Figure 1) is required with the circuitry of Figure 2. Rheostat R_{H1} acts as a threshold control. Transistor Q_3 is the photo-amplifier such as 13 of Figure 1. Transistor Q_2 operates both as the equivalent of regulation amplifier 15 of Figure 1 and

as a partial current sink. Transistor Q_1 is the main current sink of the invention. The invention relies upon the fact that ballast 31 provides enough operating voltage across, and operating current to, terminals 113 and 114 to operate transistors Q_1 , Q_2 and Q_3 .

It should be apparent that various modifications of the above will be evident to those skilled in the art and that the arrangement described herein is for illustrative purposes and is not to be considered restrictive.

Claims

1. Control circuit suitable for connection to control terminals (113, 114) of a fluorescent lamp dimmer connected to a ballast for a fluorescent lamp, said dimmer having two control terminals (113, 114) and during operation supplying energy to said control terminals, said control circuit including a light sensor (LS) which produces an output signal representative of ambient light, a first amplifier (Q_3), said light sensor (LS) being connected to said first amplifier (Q_3) which amplifies the output signal of said light sensor (LS), said first amplifier (Q_3) having an output, a second amplifier (Q_2) connected to the output of said first amplifier (Q_3), said second amplifier (Q_2) operating to regulate the output signal of said first amplifier (Q_3), said second amplifier (Q_2) having an output, characterized in that a third stage (Q_1) acting as a current sink is connected to the output of said second amplifier (Q_2) and during operation also across said two control terminals (113, 114) and in that said control circuit receives operating power for its entire operating cycle through said control terminals (113, 114).
2. A control circuit for a dimmer as claimed in Claim 1, wherein said second amplifier also acts as a current sink.
3. A control circuit for a dimmer as claimed in Claim 2, wherein said first amplifier is an NPN transistor.
4. A control circuit for a dimmer as claimed in Claim 3, wherein said second amplifier is an NPN transistor.
5. A control circuit for a dimmer as claimed in Claim 4, wherein said third stage is an PNP transistor.

Patentansprüche

1. Steuerschaltung zum Verbinden eines Fluoreszenzlampabblendreglers mit Steuerklem-

men (113, 114), der mit einem Vorschaltgerät für eine Fluoreszenzlampe verbunden ist und zwei Steuerklemmen (113, 114) enthält und im Betrieb Energie an diese Steuerklemmen liefert, wobei die Steuerschaltung mit einem Lichtsensor (LS) versehen ist, der ein das Umgebungslicht darstellendes Ausgangssignal erzeugt, und einen ersten Verstärker (Q_3) enthält, wobei der Lichtsensor (LS) mit dem ersten Verstärker (Q_3) verbunden ist, der das Ausgangssignal des Lichtsensors (LS) verstärkt, wobei der erste Verstärker (Q_3) einen Ausgang enthält, ein zweiter Verstärker (Q_2) mit dem Ausgang des ersten Verstärkers (Q_3) verbunden ist und zum Regeln des Ausgangssignals des ersten Verstärkers (Q_3) dient und einen Ausgang enthält, dadurch gekennzeichnet, daß eine dritte Stufe (Q_1) als Stromsenke dient, mit dem Ausgang des zweiten Verstärkers (Q_2) und im Betrieb ebenfalls mit den zwei Steuerklemmen (113, 114) verbunden ist, und daß die Steuerschaltung die Betriebsenergie für den ganzen Betriebszyklus über die Steuerklemmen (113, 114) empfängt.

2. Steuerschaltung für einen Abblendregler nach Anspruch 1, worin der zweite Verstärker ebenfalls als Stromsenke dient.
3. Steuerschaltung für einen Abblendregler nach Anspruch 2, worin der erste Verstärker ein npn-Transistor ist.
4. Steuerschaltung für einen Abblendregler nach Anspruch 3, worin der zweite Verstärker ein npn-Transistor ist.
5. Steuerschaltung für einen Abblendregler nach Anspruch 4, worin die dritte Stufe ein pnp-Transistor ist.

Revendications

1. Circuit de commande convenable pour être relié à des bornes de commande (113, 114) d'un gradateur de lampe fluorescente relié à un ballast conçu pour une lampe fluorescente, ledit gradateur comportant deux bornes de commande (113, 114) et, pendant le fonctionnement, alimentant de l'énergie auxdites bornes de commande, ledit circuit de commande incorporant un détecteur de lumière (LS) qui engendre un signal de sortie représentant la lumière ambiante, un premier amplificateur (Q_3), ledit détecteur de lumière (LS) étant relié audit premier amplificateur (Q_3) amplifiant le signal de sortie provenant dudit détecteur de lumière (LS), ledit premier amplificateur (Q_3) présentant une sortie, un deuxième amplificateur

(Q₂) relié à la sortie dudit premier amplificateur (Q₃), ledit deuxième amplificateur (Q₂) fonctionnant de manière à régler le signal de sortie provenant dudit premier amplificateur (Q₃), ledit deuxième amplificateur (Q₂) présentant une sortie, caractérisé en ce qu'un troisième étage (Q₁) faisant fonction d'un puits de courant est relié à la sortie dudit deuxième amplificateur (Q₂) et, en fonctionnement, également auxdites deux bornes de commande (113, 114), et en ce que ledit circuit de commande reçoit une puissance de fonctionnement pour son cycle de fonctionnement entier à travers lesdites bornes de commande (113, 114).

2. Circuit de commande pour un gradateur selon la revendication 1, dans lequel ledit deuxième amplificateur fait également fonction d'un puits de courant.
3. Circuit de commande pour un gradateur selon la revendication 2, dans lequel ledit premier amplificateur est un transistor NPN.
4. Circuit de commande pour un gradateur selon la revendication 3, dans lequel ledit deuxième amplificateur est un transistor NPN.
5. Circuit de commande pour un gradateur selon la revendication 4, dans lequel ledit troisième étage est un transistor PNP.
